Take good care of your instrument
Start with the basics
Operating tips for Beckman Coulter Avanti High Performance Centrifuges

1. Clean out any condensed water in the chamber.

2. Balance samples, then place them into the rotor cavity in a symmetric manner. Load the rotor onto the drive spindle, make sure the drive pins seat on the drive spindle hub.

3. Press down the knob, screw the rotor down tightly.

4. Remove the rotor from the centrifuge chamber after the run.

5. Clean the centrifuge rotor and cavity on a frequent basis. Wipe down the centrifuge chamber.

6. Keep the centrifuge door open to avoid condensation.

7. Lubricate the centrifuge rotor components regularly; use vacuum grease on the O-rings and spindles on metal threads.
